

Apply filters to SQL queries

Project description

This project demonstrated the application of filtering techniques in SQL queries to return specific, targeted output. All queries were written and executed within the MariaDB shell environment.

Retrieve after hours failed login attempts

This exercise demonstrates how to retrieve failed login attempts from the organization database.

The below SQL query demonstrates how I achieved the objective of retrieving after hours failed login attempts. The table is output of the code.

```
MariaDB [organization]> SELECT *  
-> FROM log_in_attempts  
-> WHERE login_time > '18:00' AND success = 0;
```

event_id	username	login_date	login_time	country	ip_address	success

Line one of the code is a SELECT statement indicating that all attributes must be returned. This is achieved by using the asterisk symbol (*) denoting all columns should be returned. Line two of the code statement specifies the name of the table where the attributes must be derived

from. Line number three includes a WHERE clause with a conditional statement indicating that the log in time should be greater than (>) 18:00. Furthermore, the WHERE clause is combined with an AND operator which combines two conditional statements, namely login time greater than 18:00 and success equal to zero. The AND operator also specifies that both conditions must be returned in the WHERE clause: login time greater than 18:00 and success is equal to zero respectively. In MySQL true and false statements, or Boolean values, are stored as 1 and 0. Numerical value 1 indicates a true statement and numerical value 0 indicates a false statement.

The output of the query is a table containing the results based on the applied filters.

The SQL query is ended by a semi-colon symbol (;) indicating the statement terminator.

The below SQL code demonstrates how to retrieve data from the log in attempts table by narrowing it down to specified dates.

```
MariaDB [organization]> SELECT *
-> FROM log_in_attempts
-> WHERE login_date = '2022-05-08' or login_date = '2022-05-09';
```

75 rows in set (0.022 sec)						

The first line of the SQL code specifies that all attributes must be returned. Line number two specifies from which table the data must be derived from. Line number three includes a

WHERE clause with an OR operator. The OR operator specifies that the first condition, second condition or both conditions can be returned in the results. In this scenario, the conditional statements indicate that the results of login date of '2022-05-08' or results of login date of '2022-05-09' or both dates can be returned respectively.

The SQL query is ended by a semi-colon symbol (;) indicating the statement terminator.

Retrieve login attempts outside of Mexico

The below SQL query demonstrates how I achieved the objective of retrieving login attempts outside of Mexico.

```
MariaDB [organization]> SELECT *  
  -> FROM log_in_attempts  
  -> WHERE NOT country LIKE 'MEX%';
```

The first line of code indicates that all attributes must be returned as denoted by the asterisk (*) symbol. Line number two specifies the name of the table where the data is derived from and line number three contains a WHERE clause, conditional statement, NOT operator, LIKE operator and wildcard symbol. The NOT logical operator negates a condition; in this case the condition is country. The LIKE operator searches for a specified pattern in an attribute and it is also used in conjunction with a wildcard symbol. The wildcard symbol is denoted by a percentage sign indicating that a specific string of data will be searched for. In this case the string is 'MEX'. The string pattern is placed in apostrophes and the percentage symbol denoting wildcard is placed at the end of the three-character string. This tells SQL to search for the pattern starting with the letters 'MEX'.

The table is the output or results of the SQL query.

The SQL query is ended by a semi-colon symbol (;) indicating the statement terminator.

Retrieve employees in Marketing

The below SQL code demonstrates how to retrieve employee information from the employees table.

The table is the output or result of the SQL query.

```
MariaDB [organization]> SELECT *
-> FROM employees;
```

The below SQL code demonstrates how to retrieve employee information from the marketing department in the East office building.

```
MariaDB [organization]> SELECT *  
  -> FROM employees  
  -> WHERE department = 'marketing' AND office LIKE 'East%';
```

employee_id	device_id	username	department	office
1000	a320b137c219	elarson	Marketing	East-170
1052	a192b174c940	jdarosa	Marketing	East-195

1156	a184b775c707	dellery	Marketing	East-417
1163	h679i515j339	cwilliam	Marketing	East-216

```
7 rows in set (0.001 sec)
```

The select statement includes a WHERE clause, two conditions, AND logical operator, LIKE operator and a wildcard symbol. The first condition specifies that the department must be marketing, as denoted by the equals to symbol (=). Condition number 2, in conjunction with the

LIKE operator and the associated wildcard percentage symbol (%) specifies that the string or pattern of data to search for in the *office* attribute must be EAST, referring to the east building. The pattern string is placed in apostrophes and the wildcard symbol is placed at the end of the character string indicating that the first set of characters must start with 'East'

The SQL query is ended by a semi-colon symbol (;) indicating the statement terminator.

Retrieve employees in Finance or Sales

The below SQL code demonstrates how to retrieve employee information in the sales and finance departments respectively.

```

The select statement includes a WHERE clause indicating two specified conditions. The conditions are combined with an OR logical operator which tells SQL to return results from the finance department, return results from the sales department or return results including both the finance or sales departments.

The output of the SQL query is a table containing results based on the conditions specified in the select statement.

The SQL query is ended by a semi-colon symbol (;) indicating the statement terminator.

Retrieve all employees not in IT

The select statement of the SQL query includes a NOT logical operator. This operator negates the condition specified in the WHERE statement. Specific to this scenario, the query tells SQL to not include results from the information technology department.

The output of the SQL query is a table based on the filters applied in the select query statement.

The SQL query is ended by a semi-colon symbol (;) indicating the statement terminator.

Summary

This project demonstrated the use of SQL query filtering techniques to retrieve targeted data from a database. Filters were applied through the implementation of logical operators, comparison operators, and wildcards, with multiple conditional statements appended to queries to refine and control the resulting output..
